

Sigma Aerospace Metals, founded in New York in 1994, has been a supplier of aircraft quality metals to the aerospace industry for a long time. We have established ourselves in the market for metallic semi-finished products for the aerospace industry in recent years. Our Head Office is in New York and since May 2016 we have a subsidiary in Bremen in Germany. During the last year we established our stock here in Bremen where you can find plenty of sheets in several alloys. For all hard to find items we are working with 27 people in total to find and pack what you need and fulfill your demand. With our Head Office in New York and our subsidiary in Germany we are in the position to be very flexible and very fast in reacting. We are working with very reliable logistic partners and we can organize your door to door transport. Moreover, we are very pleased that we had the opportunity to develop our own independent branch in Bremen, including an own warehouse at a logistically perfect location, as a curical point in the middle of Europe.

After only a year we got the opportunity to take over a small trading company from Denmark. A quality management system for trading and processing of metallic semi-finished products for the aerospace industry was also developed from the very first order, and certification took place in January 2017. As a result, the first machines were bought, starting with a foiling system to protect the sheet metal, via sheet metal guillotine shears, for dividing the large panels, to the engraving machine for permanent marking. After almost 5 years, we are now an independent company that continues to maintain close contact with customers on the basis of quality and reliability.
